NYPL Marp Template

Markdown-based presentation template for
The New York Public Library

New York
Public
Library

What is Marp?

- Marp is a markdown presentation ecosystem. It provides a CLI tool to convert markdown files into PDF, PowerPoint, and HTML slide decks.
- Syntax is based on GitHub Flavored Markdown, so you can write slides in a familiar way.
- Inserting `---` creates a new slide.

How to write slides

Add a YAML front matter to the top of your markdown file...

```
---
marp: true
theme: nypl
---
```

...and split pages by horizontal ruler (`---`). It's very simple!

```
# Slide 1

foobar

---

# Slide 2

foobar
```

How to convert to PDF or PowerPoint (CLI)

Run following commands in your terminal:

```
# PDF output
$ npx @marp-team/marp-cli@latest sample.md --theme-set ./css

# Watch mode for live preview
$ npx @marp-team/marp-cli@latest sample.md --theme-set ./css -w
```

How to preview in VS Code

Setup

- Install extention: [Marp for VS Code]
- Go to settings and search for `markdown.marp.themes`
- Add the following url:

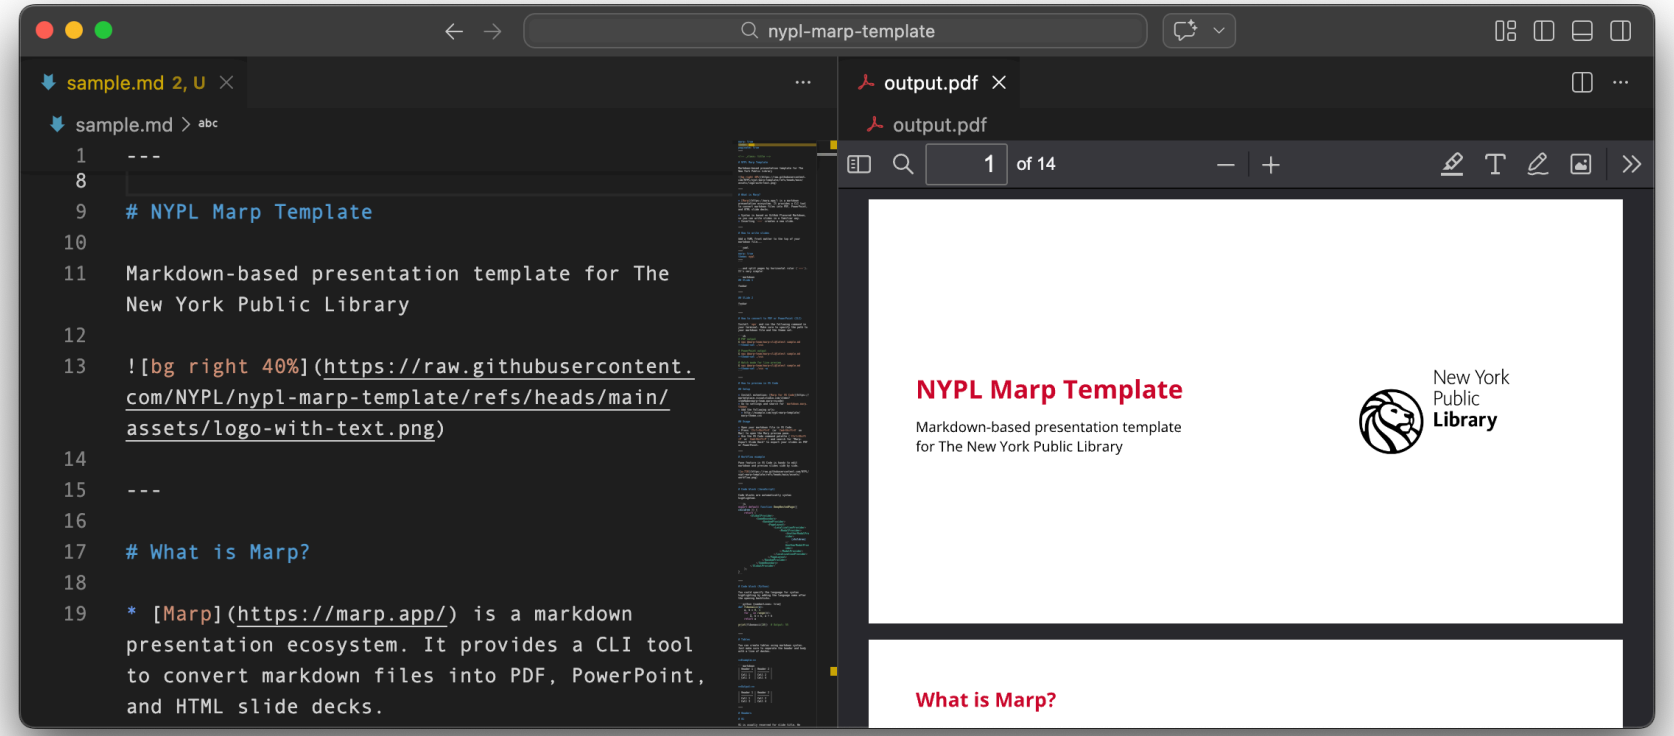
```
https://raw.githubusercontent.com/NYPL/nypl-marp-template/refs/heads/main/themes/nypl-marp-template.scss
```

Usage

- Open your markdown file in VS Code.
- Press `Ctrl+Shift+V` (or `Cmd+Shift+V` on Mac) to open the Marp preview pane.
- Use the VS Code command palette (`Ctrl+Shift+P` or `Cmd+Shift+P`) and search for "Marp: Export Slide Deck" to export your slides as PDF or PowerPoint.

Workflow example

Pane feature in VS Code is handy to edit markdown and preview slides side by side.



Code block (JS/TS, Python)

Supports syntax highlighting.

```javascript
function fibonacci(n) {
  let a = 0, b = 1;
  for (let i = 0; i < n; i++) {
    [a, b] = [b, a + b];
  }
  return a;
}

console.log(fibonacci(10));  // Output: 55
```

```python
def fibonacci(n):
    a, b = 0, 1
    for _ in range(n):
        a, b = b, a + b
    return a

print(fibonacci(10))  # Output: 55
```

Code block (Ruby, Diff)

```ruby
def fibonacci(n)
  a, b = 0, 1
  n.times do
    a, b = b, a + b
  end
  a
end

puts fibonacci(10) # Output: 55
```

```diff
- old line
+ new line
```

Tables

Supports table markdown syntax.

Example:

```
| Header | Header | Header | Center | Right |
| ------ | ------ | ------ | :----: | ----: |
| Cell   | Cell   | Cell   |  Cell  |  100% |
| Cell   | Cell   | Cell   |  Cell  |   50% |
| Cell   | Cell   | Cell   |  Cell  |   30% |
```

Output:

Header	Header	Header	Center	Right
Cell	Cell	Cell	Cell	100%
Cell	Cell	Cell	Cell	50%
Cell	Cell	Cell	Cell	30%

Headers

H1

H1 is usually reserved for slide title. We recommend using `H2` - `H4` for content.

H2

NYPL's Mission Statement

H3

The mission of The New York Public Library is to inspire lifelong learning, advance knowledge, and strengthen our communities.

H4

To deliver on this promise, we rely on three great resources—our staff, our collections, and our physical and digital spaces—to provide opportunities for learning and growth to all New Yorkers.

Text formatting

Bold text is supported, as well as *italic* and ***bold italic***. You can also create lists:

- Unordered list item 1
- Unordered list item 2
  - Unordered list item 3
  - Unordered list item 4

1. Ordered list item 1
2. Ordered list item 2
3. Ordered list item 3

Links and images

You can insert links and images using markdown syntax. With size modifiers (e.g. `w:300 left`), you can adjust the size of images to fit your slides.

Math formulas

We could also use $\LaTeX$ syntax. Wrap formula in `$$` to render it as a block, or in `$` to render it inline.

$$I_{xx} = \int\int_R y^2 f(x, y) \cdot dydx$$

Thank you!
